

Group Member / Ideal Job	Differences
Khaled Project/Engagement Manager	Most of the ideal jobs in Input [T7] are related to programming front-end, back-end relating to applications and games. Some are on the physical end in regard to systems. The ideal job that I had put down was a Project/Engagement Manager which is fundamentally different in regard to my group which would require me to hold relations of customers and shareholders gathering their thoughts. Whereas my group's ideal jobs are to program/code or install and maintain systems with fellow workers
Amani Front-End Developer Nintendo Aus.	The front-end developer position at Nintendo Australia best describes my ideal job as it involves working with the Digital Performance team on the development and maintenance of the Nintendo Australia website. The individual will be responsible for coordinating updates to the website as well as being involved in coordinating digital projects, collaborating with global teams on project rollouts and strategy, and reviewing the performance digital projects. In addition, the individual will be responsible for ensuring that all executions meet the company's legal and ethical standards and that all deadlines are being met. As a career, being employed as a front-end developer for Nintendo certainly appeals to myself but it would be to many others. The employer, being Nintendo, provides any of its employees with a substantial amount of credibility because of its well-known name. Moreover, the position highlights the importance of implementing creativity and technical skills to design and improve the user interfaces for its website which I would be keen on being involved in. Currently I am involved with deploying softwares and managing its software and licenses at a university but since IT is such a broad field, the hard skills does not overlap with the ideal job previously displayed.
James Level 3 IT Technician	After looking over the ideal jobs of my team members, the most in demand jobs in order are front end developers, Helpdesk, support related roles, software engineers, and project and property operations managers. The set of skills required for these roles are first and foremost coding, alongside troubleshooting, the ability to provide tech support and customer service (if the support role deals with customers that is), and management skills. Coding and tech support will always be in high demand from employers whereas management roles tend to be less in demand due to less positions for said management needing to be filled in. As for the It skills I do not have that are highly ranked, those would be programming as I am still learning python, Data analysis, and dev ops. For general skills that are highly ranked that I don't have, they are data analysis, software development, and web development. My opinion of my ideal job has not changed since looking at the data, as not only would my position remain to be in high demand, but its something I am passionate about, which is important to me
Luke IT Support	Looking at the group's ideal jobs everyone seems to have a clear idea of where they want to be in the future. For myself though I don't have much exposure to IT, so I am still indecisive of what my ideal job would be. For now, I choose IT support because it has a broad of experience involved in the job. When it comes to comparison to the other jobs some are going down the path of programming/coding or looking to get into a Managers role, while mine will be more focused on maintenance and support.
Josh Software Engineer Google	After reading through my groups ideal roles I am seeing that we are mostly heading in different directions within the IT sector. I am looking for a role that requires me to come up with creative solutions to IT problems through software engineering and implement them within a large organisation. The differences are varied between members and their chosen jobs. Broadly speaking, only a few people are aiming for work at specific businesses. This is probably due to the influence these companies have made on our day-to-day lives.
Nicholas	The ideal job in IT for me would be an IT Property Operations Manager for a precinct, such as The Star. Working in a precinct is exciting for me as I would be able to see and interact with different aspects of the business, eg. Food & Beverage, Entertainment, Gaming etc., and no two days of work would be the same. The position at The Star will require me to me to find and implement new IT initiatives and continually service and maintain existing IT infrastructure within the property. The role would require me to lead a team of people in IT operations and planning for future upgrades and improvements within the property.
Victor	My Ideal job would be a gameplay engineer. This position entails being responsible for development of gameplay for a video game and other people who are working on it. You work on early versions of the game with several people to make the experience as nice as it can be for the players. This also entails complex communications with other teams to develop a game.
